(54) Title: HAIR CLIP FOR FINE HAIR

WO 01/39626 A1

(57) Abstract: A hair clip (10) includes a formation defining an elongated base arm (11) having two knobs (25 and 26), an elongated closure arm (12) defining two apertures (15 and 16), and a hinge region (14) connecting the arms for pivotal movement between open and closed positions. Knob (25) has a stem portion (33) and a free end portion (35) defining an end area with a peripheral acute angle flat-face detent (41). Knob (26) has a stem portion (34) and a free end portion (36) defining an end area with a peripheral acute angle flat-face detent (42). In a preferred embodiment, the hair clip, when closed, defines a passage for hair having several sharp bends, including acute angle 180° bends. In a preferred embodiment, the passage passes between the inner face of the closure arm and the inner face of the base member at a first side of the hair clip, between a first interior side of the aperture and a first side of the stem, between the face of the detent and the outer face of the closure arm at the first side of the hair clip, over the free end portion of the knob, between the face of the detent and the outer face of the closure arm at a second side of the hair clip, between a second interior side of the aperture and a second side of the stem, and between the inner face of the closure arm and the inner face of the base member at the second side of the hair clip.
